

## ADVANCE DEVOPS EXP 4

**Niraj S. Kothawade**  
**D15A - 24**

**Aim:** To install Kubectl and execute Kubectl commands to manage the Kubernetes cluster and deploy Your First Kubernetes Application.

### Step 1: Install Kubectl on Ubuntu

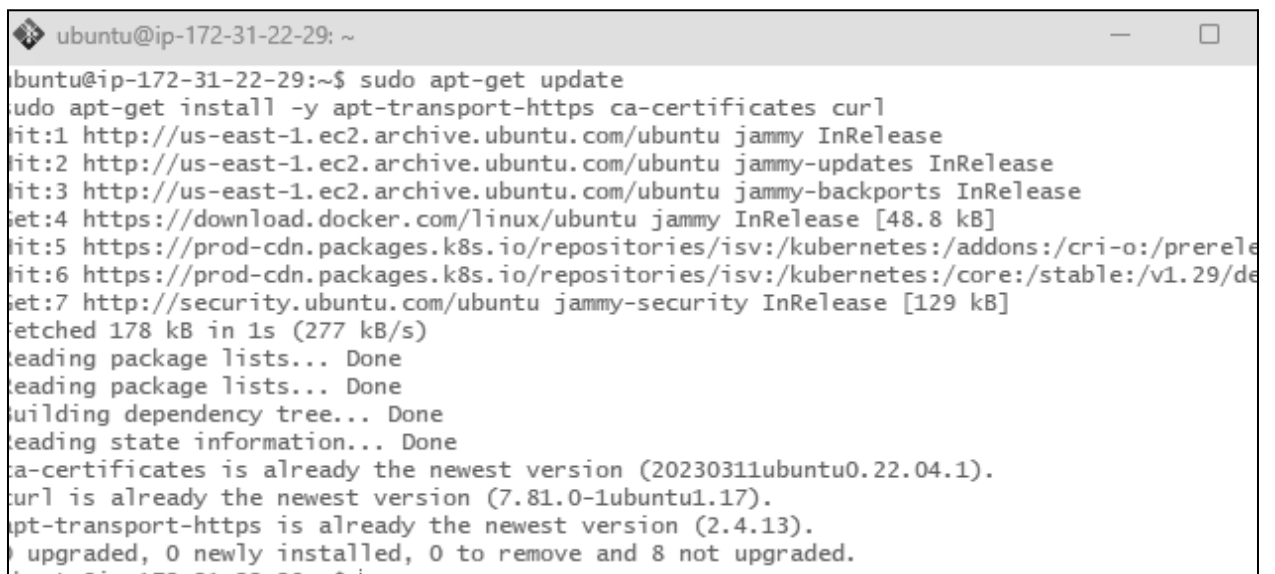

#### 1.1 Add Kubernetes APT repository

First, add the Kubernetes repository to your system.

##### 1. Install prerequisites:

```
sudo apt-get update
```

```
sudo apt-get install -y apt-transport-https ca-certificates curl
```

```
ubuntu@ip-172-31-22-29: ~  
ubuntu@ip-172-31-22-29:~$ sudo apt-get update  
sudo apt-get install -y apt-transport-https ca-certificates curl  
Hit:1 http://us-east-1.ec2.archive.ubuntu.com/ubuntu jammy InRelease  
Hit:2 http://us-east-1.ec2.archive.ubuntu.com/ubuntu jammy-updates InRelease  
Hit:3 http://us-east-1.ec2.archive.ubuntu.com/ubuntu jammy-backports InRelease  
Get:4 https://download.docker.com/linux/ubuntu jammy InRelease [48.8 kB]  
Hit:5 https://prod-cdn.packages.k8s.io/repositories/isv:/kubernetes:/addons:/cri-o:/prerelease InRelease  
Hit:6 https://prod-cdn.packages.k8s.io/repositories/isv:/kubernetes:/core:/stable:/v1.29/debian InRelease  
Get:7 http://security.ubuntu.com/ubuntu jammy-security InRelease [129 kB]  
Fetched 178 kB in 1s (277 kB/s)  
Reading package lists... Done  
Reading package lists... Done  
Building dependency tree... Done  
Reading state information... Done  
ca-certificates is already the newest version (20230311ubuntu0.22.04.1).  
curl is already the newest version (7.81.0-1ubuntu1.17).  
apt-transport-https is already the newest version (2.4.13).  
0 upgraded, 0 newly installed, 0 to remove and 8 not upgraded.
```

##### 2. Add the GPG key for Kubernetes:

```
sudo curl -fsSL https://packages.cloud.google.com/apt/doc/apt-key.gpg
```

<https://packages.cloud.google.com/apt/doc/apt-key.gpg>

```
ubuntu@ip-172-31-22-29:~$ sudo curl -fsSL https://packages.cloud.google.com/apt/doc/apt-key.gpg
```

### 3. Add the Kubernetes repository:

```
echo "deb [signed-by=/usr/share/keyrings/kubernetes-archive-keyring.gpg]
https://apt.kubernetes.io/ kubernetes-focal main" | sudo tee
/etc/apt/sources.list.d/kubernetes.list
```

```
ubuntu@ip-172-31-22-29:~$ echo "deb [signed-by=/usr/share/keyrings/kubernetes-archive-keyring
.gpg] https://apt.kubernetes.io/ kubernetes-focal main" | sudo tee /etc/apt/sources.list.d/ku
bernetes.list
deb [signed-by=/usr/share/keyrings/kubernetes-archive-keyring.gpg] https://apt.kubernetes.io/
kubernetes-focal main
```

## 1.2 Install kubectl

Now install kubectl:

```
sudo apt-get update
```

```
sudo apt-get install -y kubectl
```

```
ubuntu@ip-172-31-22-29:~$ sudo apt-get update
sudo apt-get install -y kubectl
Hit:1 http://us-east-1.ec2.archive.ubuntu.com/ubuntu jammy InRelease
Get:2 http://us-east-1.ec2.archive.ubuntu.com/ubuntu jammy-updates InRelease [128 kB]
Hit:3 http://us-east-1.ec2.archive.ubuntu.com/ubuntu jammy-backports InRelease
Hit:4 http://security.ubuntu.com/ubuntu jammy-security InRelease
Hit:5 https://download.docker.com/linux/ubuntu jammy InRelease
Hit:6 https://prod-cdn.packages.k8s.io/repositories/isv/kubernetes:/addons:/cri-o:/prerelease:/main/deb InRelease
Ign:7 https://packages.cloud.google.com/apt kubernetes-focal InRelease
Err:8 https://packages.cloud.google.com/apt kubernetes-focal Release
 404 Not Found [IP: 172.253.62.138 443]
Reading package lists... Done
E: The repository 'https://apt.kubernetes.io kubernetes-focal Release' does not have a Release file.
N: Updating from such a repository can't be done securely, and is therefore disabled by default.
N: See apt-secure(8) manpage for repository creation and user configuration details.
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
kubectl is already the newest version (1.29.0-1.1).
0 upgraded, 0 newly installed, 0 to remove and 5 not upgraded.
```

Verify the installation(extra):

```
kubectl version --client
```

```
ubuntu@ip-172-31-22-29:~$ kubectl version --client
Client Version: v1.29.0
Kustomize Version: v5.0.4-0.20230601165947-6ce0bf390ce3
```

## Step 2: Deploying Your Application on Kubernetes

### 2.1 Set up Kubernetes Cluster

1. If you haven't already set up a Kubernetes cluster (e.g., with kubeadm), use minikube or any managed Kubernetes service (like EKS, GKE, etc.) to get a cluster running.
2. Once your cluster is ready, verify the nodes:

```
kubectl get nodes
```

```
ubuntu@ip-172-31-45-227:~$ kubectl get nodes
NAME                                STATUS    ROLES    AGE     VERSION
ip-172-31-43-211                    Ready     <none>    50s     v1.29.0
ip-172-31-45-13                     Ready     <none>    34s     v1.29.0
ip-172-31-45-227                    Ready     control-plane 5m17s   v1.29.0
ubuntu@ip-172-31-45-227:~$ |
```

### Step 3: Create the Deployment YAML file

a) Create the YAML file: Use a text editor to create a file named nginx-deployment.yaml

```
ubuntu@ip-172-31-45-227:~$ nano nginx-deployment.yaml
```

b) Add the Deployment Configuration: Copy and paste the following YAML content into the file. Save and exit the editor (Press Ctrl+X, then Y, and Enter).

```
ubuntu@ip-172-31-45-227: ~
GNU nano 6.2 nginx-deployment.yaml
apiVersion: apps/v1
kind: Deployment
metadata:
  name: nginx-deployment
  labels:
    app: nginx
spec:
  replicas: 2
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx:1.21.3
        ports:
        - containerPort: 80
```

#### Step 4: Create the Service YAML File

a) Create the YAML File: Create another file named nginx-service.yaml

```
ubuntu@ip-172-31-45-227:~$ nano nginx-service.yaml
```

b) Add the Service Configuration: Copy and paste the following YAML content into the file given below.

```
ubuntu@ip-172-31-45-227: ~
GNU nano 6.2 nginx-service.yaml *
apiVersion: v1
kind: Service
metadata:
  name: nginx-service
spec:
  selector:
    app: nginx
  ports:
  - protocol: TCP
    port: 80
    targetPort: 80
  type: LoadBalancer
```

### Step 5: Apply the YAML Files

a) Deploy the Application: Use kubectl to create the Deployment and Service from the YAML files.

```
ubuntu@ip-172-31-45-227:~$ kubectl apply -f nginx-deployment.yaml
kubectl apply -f nginx-service.yaml
deployment.apps/nginx-deployment created
service/nginx-service created
```

b) Verify the Deployment: Check the status of your Deployment, Pods and Services.

```
ubuntu@ip-172-31-45-227:~$ kubectl get deployments
kubectl get pods
kubectl get services
```

NAME	READY	UP-TO-DATE	AVAILABLE	AGE
nginx-deployment	2/2	2	2	40s

```
NAME
```

NAME	READY	STATUS	RESTARTS	AGE
nginx-deployment-6b4d6fdbf-6k84m	1/1	Running	0	40s
nginx-deployment-6b4d6fdbf-9d8j6	1/1	Running	0	40s

```
NAME
```

NAME	TYPE	CLUSTER-IP	EXTERNAL-IP	PORT(S)	AGE
kubernetes	ClusterIP	10.96.0.1	<none>	443/TCP	40m
nginx-service	LoadBalancer	10.106.182.152	<pending>	80:32317/TCP	40s

## Describe the deployment(Extra)

```
ubuntu@ip-172-31-45-227:~$ kubectl get deployments
NAME                READY   UP-TO-DATE   AVAILABLE   AGE
nginx-deployment    1/1     1            1           14h
ubuntu@ip-172-31-45-227:~$ kubectl describe deployment
Name:                nginx-deployment
Namespace:           default
CreationTimestamp:    Wed, 11 Sep 2024 17:16:17 +0000
Labels:              <none>
Annotations:         deployment.kubernetes.io/revision: 2
Selector:             app=nginx
Replicas:            1 desired | 1 updated | 1 total | 1 available | 0 unavailable
StrategyType:        RollingUpdate
MinReadySeconds:     0
RollingUpdateStrategy: 25% max unavailable, 25% max surge
Pod Template:
  Labels:  app=nginx
  Containers:
    nginx:
      Image:      nginx:latest
      Port:       80/TCP
      Host Port:  0/TCP
      Environment: <none>
      Mounts:
        /usr/share/nginx/html from website-volume (rw)
  Volumes:
    website-volume:
      Type:      ConfigMap (a volume populated by a ConfigMap)
      Name:      nginx-website
      Optional:  false
Conditions:
  Type           Status  Reason
  ----           -
  Available      True    MinimumReplicasAvailable
  Progressing    True    NewReplicaSetAvailable
OldReplicaSets:  nginx-deployment-6b4d6fdbf (0/0 replicas created)
NewReplicaSet:   nginx-deployment-776b8fd845 (1/1 replicas created)
Events:          <none>
```

## Step 6:Ensure Service is Running

**6.1 Verify Service:** Run the following command to check the services running in your cluster:

kubectl get service

```
ubuntu@ip-172-31-45-227:~$ kubectl get service
NAME            TYPE          CLUSTER-IP      EXTERNAL-IP  PORT(S)          AGE
kubernetes      ClusterIP     10.96.0.1       <none>       443/TCP          16h
nginx           NodePort      10.106.0.176    <none>       80:32618/TCP     76m
nginx-service   NodePort      10.106.182.152  <none>       80:30007/TCP     15h
nginx2          NodePort      10.99.32.156    <none>       80:31421/TCP     8s
```

## Step 7: Forward the Service Port to Your Local Machine

kubectl port-forward allows you to forward a port from your local machine to a port on a service running in the Kubernetes cluster.

1. **Forward the Service Port:** Use the following command to forward a local port to the service's target port.

kubectl port-forward service/<service-name> <local-port>:<service-port>

```
ubuntu@ip-172-31-45-227:~$ kubectl port-forward service/nginx-service 8080:80
Forwarding from 127.0.0.1:8080 -> 80
Forwarding from [::1]:8080 -> 80
```

This command will forward local port 8080 on your machine to port 80 of the service nginx-service running inside the cluster.

2. This means port forwarding is now active, and any traffic to localhost:8080 will be routed to the nginx-service on port 80.

```
ubuntu@ip-172-31-45-227:~$ kubectl port-forward service/nginx-service 8080:80
Forwarding from 127.0.0.1:8080 -> 80
Forwarding from [::1]:8080 -> 80
^Cubuntu@ip-172-31-45-227:~$ kubectl port-forward service/nginx-service 8081:8080
Forwarding from 127.0.0.1:8081 -> 80
Forwarding from [::1]:8081 -> 80
^Cubuntu@ip-172-31-45-227:~$ kubectl get pods
NAME                                READY   STATUS    RESTARTS   AGE
nginx-deployment-776b8fd845-k9cx4   1/1     Running   0           113m
ubuntu@ip-172-31-45-227:~$ kubectl logs nginx-deployment-776b8fd845-k9cx4
/docker-entrypoint.sh: /docker-entrypoint.d/ is not empty, will attempt to perform configuration
/docker-entrypoint.sh: Looking for shell scripts in /docker-entrypoint.d/
/docker-entrypoint.sh: Launching /docker-entrypoint.d/10-listen-on-ipv6-by-default.sh

/docker-entrypoint.sh: Configuration complete; ready for start up
2024/09/12 06:35:51 [notice] 1#1: using the "epoll" event method
2024/09/12 06:35:51 [notice] 1#1: nginx/1.27.1
2024/09/12 06:35:51 [notice] 1#1: built by gcc 12.2.0 (Debian 12.2.0-14)
2024/09/12 06:35:51 [notice] 1#1: OS: Linux 6.5.0-1022-aws
2024/09/12 06:35:51 [notice] 1#1: getrlimit(RLIMIT_NOFILE): 1048576:1048576
2024/09/12 06:35:51 [notice] 1#1: start worker processes
2024/09/12 06:35:51 [notice] 1#1: start worker process 24
2024/09/12 06:35:51 [notice] 1#1: start worker process 25
```

## Step 8: Access the Application Locally

1. **Open a Web Browser:** Now open your web browser and go to the following URL:

`http://localhost:8080`

You should see the application (in this case, Nginx) that you have deployed running in the Kubernetes cluster, served locally via port 8080.

In case the port 8080 is unavailable, try using a different port like 8081
